

Data Visualization

Deliverable 3

Geospatial data is a relevant resource for telling a story through the visualization of territories. The third deliverable of the semester project will evaluate the storytelling of the chosen dataset, the inclusion of geospatial data plots (e.g., Geomap), and the inclusion of spatial autocorrelation analysis.

This deliverable will correspond to only one vertical A4 page—legend included—and a dashboard link from Streamlit. On this single page, the group must provide as much information as possible, extracted from the chosen dataset. The groups must balance the cognitive burden of readers and the quality of content, colors, and graphics. The deliverable must be completely in Spanish or English. The percentage of this deliverable is 30% of the final evaluation of the semester project.

The groups can submit their deliverables on Canvas until June 18th at 23h59.

The evaluation will consider the following aspects:

- Quality of figures in terms of clarity, consistency of font sizes throughout the document, and the selection of colors (1.5 pts)
- The complexity of the analyses chosen, and the interplay and complementarity of each graph (1.5 pts)
- The dashboard is completely aligned with the plots provided in the report (1 pt).
- The correct inclusion of a map using geospatial data with a proper metric, and the message obtained from the figures is clear for a non-specialized audience (1 pt)
- The legend content is detailed and self-explanatory (1 pt)

Additionally, the evaluation will consider the concepts of ugly, bad, and wrong, as explained in the lectures, as a form to evaluate the graphs. The number of graphics is unlimited, but a successful deliverable should meet the following plot and analysis requirements:

- Contain at least six plots total.
- One plot must visualize a measure of growth (e.g., GDP growth with respect to last year) as a feature.
- One plot must be either a Sankey diagram or a radar plot.
- The deliverable **must** include a spatial autocorrelation analysis (e.g., Moran's I).
- Each plot type included in the deliverable can be repeated at most twice. To clarify, a bar plot and a stacked bar plot are considered the same plot type.

For every two detectable spelling errors in the review, 0.1 points will be deducted from the report grade, with a maximum deduction equivalent to 2 points.

After completing this deliverable, we expect to contribute to the completion of the following learning outcomes (as defined in the course syllabus):

- R1. Evaluate and set up automated reporting systems
- R2. Propose and Evaluate Strategies for Data Standardization and Visualization, either in Academia or Business
- R3. Critically Define the Choice of Graphics to be used in Automated Reporting Systems
